BPExch Login Help & Safety Guide

Tell the genuine BpExch Login page from a clone in three looks — and fix sign-in failures in the right order.

At a glance — verified November 2026

Genuine page title	“BpExch Login” — exactly that capitalisation in the browser tab / page title.
Genuine form	Two fields only: username and password. No email, no phone, no OTP at sign-in.
Address	The login address rotates. Get the current address from the desk; old bookmarks go stale.
Resets & unlocks	Free, always. Any “unlock fee” or “migration fee” is a scam.
Never share	Your password, wallet PIN or any OTP — with anyone, including anyone claiming to be the desk.
Lock-out	Repeated wrong passwords can lock sign-in for about 15 minutes. Wait; do not keep guessing.

1. The three-looks genuine-page check

Clone pages copy the real login form almost perfectly. Before you type anything, do the three looks — in this order, every time the address has changed or a link came from someone else:

1. **Look 1 — Title.** The genuine page is titled “BpExch Login”. A different title, extra words (“BPExch Official Bonus Login”), or a betting-brand name you do not recognise means stop.
2. **Look 2 — Two-field form.** Username and password only. Any extra field — email, mobile number, CNIC, deposit amount, promo code — means it is not the genuine sign-in form, however familiar the colours look.
3. **Look 3 — Trusted source.** Did this address come from the desk on WhatsApp or from BPExchOnline.com in this session? A link from a random Telegram channel, a comment, a bonus ad or another punter fails this look even if Looks 1 and 2 pass.

All three looks must pass. Two out of three is a fail: close the page, message the desk for the current address, and start again from the trusted source.

2. Sign-in steps

1. Get the current login address from the desk (it rotates; do not trust an old bookmark alone).
2. Run the three-looks check above.
3. Type your username exactly as issued — watch for 0/O and 1/l mix-ups, and switch off autocapitalise if your phone changes the first letter.

4. Type your password (use paste from your password manager if you saved it there; never ask anyone to type it for you).
5. Sign in once and wait for the home screen. Double-tapping or refreshing mid-login can look like a failure when it is not.

Android users: the desk supplies an APK directly (the app is not on Google Play) — install only the file the desk sends, and check it opens the same two-field login. iPhone users: use the mobile web page and add it to the home screen; there is no App Store version to download.

3. When sign-in fails — work in this order

1. **Address.** Has the address rotated since your bookmark was saved? Get the fresh address from the desk first — this fixes most “failures”.
2. **Username.** Re-type it character by character from the desk’s original message. Check capitalisation and look-alike characters.
3. **Password.** One careful attempt with the password you set (not the starter password, if you already changed it).
4. **Lock (~15 minutes).** After repeated wrong attempts the account can lock temporarily. Stop trying, wait about 15 minutes, then make one careful attempt. Continued guessing restarts the problem.
5. **Status.** If a correct address, username and password still fail after the wait, ask the desk to check the account status — send what Section 6 lists, never your password.

Do not jump the order. Resetting a password when the real problem was a stale address leaves you with two problems and a new password to memorise.

4. Free password reset — the real steps

1. Message the desk on WhatsApp from your usual number. Give your username and say “password reset”.
2. The desk confirms the account and issues a new starter password. This is free — no fee, no deposit required, no “verification payment”.
3. Sign in with the new starter password (run the three-looks check first).
4. Change it immediately to your own password, then sign out and back in to prove the new one works.

5. The two fee scams

The unlock-fee scam. Your account is “locked” (often after a clone site harvested your password, or simply as a story) and a “support” contact demands Rs 2,000–Rs 10,000 to unlock it. Reality: temporary locks clear in about 15 minutes and desk resets are free. Paying buys nothing and marks you as a payer for the next scam.

The migration-fee scam. You are told BPExch has “moved” and your balance needs a paid “migration”, “conversion” or “KYC activation” to survive. Reality: the login address does rotate — the desk gives you the new address free, your username, password and balance carry over, and no migration payment exists. Any page or person charging for an address change is a clone operation.

In both scams the cure is the same: stop, close the page or chat, and contact the desk only through the WhatsApp number on BPExchOnline.com.

6. Screenshot hygiene & what to send the desk

- Crop or cover the password field, your wallet balance details you do not need to share, and any OTP before sending any screenshot, anywhere.

- Never screenshot your password, your wallet PIN screen, or a one-time code — not even “privately”. Screenshots forward, back up to clouds and get re-shared.
- Error screenshots are useful: the error words help the desk. Crop to the error message and your username; nothing else is needed.

When you are stuck, send the desk exactly this, in one message: (1) your username, (2) the exact error words on screen (or a cropped screenshot of them), (3) what you already tried from the Section 3 order, and (4) the time the problem started. Never send your password — a genuine desk can check status, reset a password and trace a login without ever seeing it. If anyone asks for it, you are not talking to the desk.
